

Data Operations & Financial Analytics

Selected dashboard examples across financial operations, risk review, and operational reporting

In my recent role, I worked with transaction, expense, procurement, and vendor data to support risk and fraud analysis through dashboards. These reports helped finance and operations teams quickly identify exceptions, trends, and flagged activity without digging through large spreadsheet files. The examples below show how I turned operational data into practical reporting views for faster review and better decision-making.

Portfolio focus

- Transaction monitoring and exception review
- Expense, reimbursement, and procurement analytics
- Vendor, material, and payment-term reporting
- KPI views with drill-down paths for reviewers

Reporting focus

- Building clean, reliable reporting views teams can trust
- Supporting financial operations and performance reporting
- Turning complex data into usable dashboards and review outputs
- Creating KPI views, exception paths, and trend reporting
- Connecting operations, finance, and reporting needs

Tools used

SQL • Power BI • Excel

41.9K	8.1K	\$1.25M	28.98K	\$165M
Expense transactions	Flagged transactions	Expense amount	Purchase orders	PO amount

Sensitive names, IDs, material descriptions, and internal identifiers are anonymized. Dashboard structure, headers, metrics, and visuals are preserved.

Operational Risk & Expense Monitoring

What I built

- Centralized expense KPIs, flagged transaction metrics, geography, and year-over-year trends into one monitoring view.
- Separated total activity from flagged activity so reviewers could start with the exceptions instead of rebuilding filters.
- Kept the dashboard simple enough for daily use while still supporting category and employee-level review.

What it helped the team do

- See a 19.27% transaction flag rate without manual filtering.
- Track \$738K in flagged activity against \$1.25M total expense activity.
- Review geographic spend and flagged-vs-total expense trends in the same workflow.

Business value

This dashboard made expense exceptions easier to review by connecting KPI cards, flagged activity, geographic spend, and trend reporting in one place. It gave finance and operations teams a repeatable way to review flagged transactions without rebuilding spreadsheet filters.

Expense overview - KPI cards, geographic spend map, and flagged vs. total expense trend

Financial Operations & Employee Analytics

What I built

- Built views for expense amount, claim amount, reimbursement activity, and employee participation.
- Created top-contributor and monthly trend views so review teams could spot outliers without separate employee-level pulls.
- Connected monthly expense movement to employee count and filters such as date, country, and expense type.

What it helped the team do

- Identify high-volume and high-amount expense patterns at the employee level.
- Spot months where expense activity moved differently from employee count.
- Give finance reviewers a faster way to prioritize what needed follow-up.

Business value

This connects closely to financial operations and AR-style review work: the value is not only the dashboard, but the cleaner review pattern it creates for the team.

Top employee analysis - expense amount, claim amount, and reimbursement activity views

Monthly expense trend - expense amount compared with active employee count

Procurement & Vendor Operations Analytics

What I built

- Built a procurement overview for vendor flags, PO flags, total spend, and flagged spend.
- Added drill-down views by material, vendor category, company code, and payment terms.
- Turned a high-level flagged amount into a clearer review path for procurement and finance teams.

What it helped the team do

- Track 50 flagged vendors out of 124 in the overview layer.
- Monitor 401 flagged POs against a \$165M procurement base.
- Surface missing payment terms as a concrete process fix opportunity.

Business value

This dashboard connected procurement KPIs with vendor, material, company code, and payment-term breakdowns. It helped turn high-level flagged amounts into specific review paths for procurement and finance teams.

PO overview - vendor flag rate, PO flag rate, geographic vendor distribution, and time trend

Procurement breakdown - material, vendor category, company code, and payment-term analysis

Reporting and Analytics Strengths

Data Operations	Financial Operations Reporting	Business Review Support
• Build KPI views people can trust • Investigate messy data until the issue is clear • Create review queues and exception paths • Track trends without adding manual work	• Expense and payment visibility • Procurement and vendor reporting • Flagged amount monitoring • Operational finance dashboards	• Prioritize the work that affects decisions • Reduce repeated spreadsheet pulls • Communicate clearly with operators • Iterate quickly with stakeholders
